## A Programmatic Approach to Sewer Screening

NJWEA WINTER TECHNOLOGY TRANSFER SEMINAR 2026

Chris Skehan  
IDEX Intelligent Water

1

### Condition Assessment

#### How Close are we to the next "Catastrophic Failure" (210 miles)

EPA estimates **23,000 to 75,000** SSOs annually.  
It is estimated a substantial number are caused by infrastructure failure.

Estimated **240,000** sewer failures a year.  
Comparing age of infrastructure to sewer failure frequency suggests a possible correlation.

Infrastructure is **45 years old** on average in the USA.  
Aging infrastructure has a significant impact on failure.

2025 **American Society of Civil Engineers Infrastructure Report Card**

Year	1988	1998	2001	2005	2009	2013	2017	2021	2025
Wastewater Grade	C	D+	D	D-	D-	D	D+	D+	<b>D+</b>

**“ Utilities should use continuous, data-driven asset management to extend infrastructure life and focus limited funds where they matter most... ”**

2

### Condition Assessment

#### What is Condition Assessment?

Systematic inspection of a Collection System to identify current state to maintain optimal performance and prioritize maintenance and rehabilitation efforts.

#### Why do we do it?

- ◆ Avoid catastrophic failures
- ◆ Extends lifespan of infrastructure
- ◆ Optimizes resource allocation
- ◆ Improves environmental impact

#### Various Technologies

- ◆ CCTV
- ◆ Laser Profiling
- ◆ Sonar Screening
- ◆ Smoke Testing
- ◆ Dye Testing
- ◆ Manhole Inspections
- ◆ Acoustic Testing
- ◆ Flow Monitoring

**Large diameter pipes can be the most difficult to deploy these technologies where **failure can present the most critical impact****

2026 © ADS LLC | Commercial in Confidence

3

### LET'S FOCUS ON THE BIG STUFF

#### Large Diameter Sewers

- ◆ Trunk and Interceptors +15"
- ◆ 1% - 7% of the total network
- ◆ Large user base

#### Why are they important?

- ◆ High Consequence of Failure
- ◆ Biggest Impact to Service

# NJWEA - Winter Tech Transfer 2026 Cleaning and Inspection

### Large Pipe ... Large Problems

**Hard Access**

- Legacy construction in lowest lying points, creeks & rivers
- Buried over time with airports, bridges, and railroads

**Operationally Active**

- Difficult to isolate without disruption

**Barriers to inspect regularly**

- Don't have the tools and resources
- Budget for advanced inspection technology

5

### Screening Level Assessments (SLA)

ABS | subterra  
www.adsenv.com/flowsight

Assets should be prioritized based on criticality. Interceptor sewers are critical and require more monitoring and attention than others.

**Screening Level Assessments** provide rapid detection of grade 4 and 5 defects (the major issues) on critical high impact infrastructure.

**Now** – Needs to be addressed immediately

**Soon** – Begin planning (Timeline, funding, tools needed)

**Later** – Observe and Screen

How it Works! AGS | subterra  
www.adsenv.com/flowsight

## How Screening Works

**1**

**Inspect and Test**

Review Existing GIS and System Information

**2**

**Deploy and Collect**

ADS captures the data using the Scout Technology

**3**

**Convert and Process**

Data converted into georeferenced information

**4**

**Screen and Compare**

Condition criteria tagged, located, & compared

**5**

**Report and Build**

Initial condition report followed by change logs

2026 © ADS LLC | Commercial in Confidence

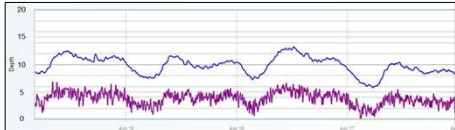

9

Inspect and Test Phase

### Pre-Inspection is Key

- Review of Sites
- Site Access
- GIS Review
- Velocity Data Review
- Depth Data Review

2026 © ADS LLC | Commercial in Confidence

10

Deploy and Collect AGS | subterra  
www.adsenv.com/flowsight

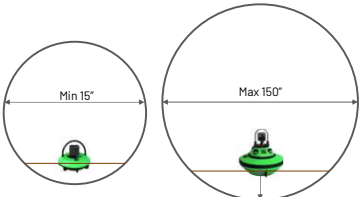

## Screening uses "Scouts"

**Run Time**  
55 Minutes (standard)  
3 Hours (option)

**Lightweight**  
7-9 lbs. (4 kg)

**Dimensions**  
7-16" diameter  
9-14" height

**Optimal Performance in...**

- Gravity-fed sanitary sewers 15"-150" in diameter
- Flows 1-6 fps

**Plan and accommodate for...**

- Drop connections/waterfalls

**DETECTING HYDRAULIC JUMPS IN LIVE SEWERS**

What the hydraulic performance screening [flow profile] reveals, why PACP can't code it, and what it means for CMOM capacity management

**LIVE CAPTURE: HYDRAULIC JUMP EVENT**

**WHAT IS THIS?**  
A hydraulic jump — flow transitions from supercritical ( $Fr > 1$ ) to subcritical ( $Fr < 1$ ). Excess kinetic energy dissipates as turbulence. The video captures the float passing through the jump; the graph quantifies the regime change at that exact location.

**WHY DOES IT MATTER?**  
Every hydraulic jump is energy that should be moving wastewater, but is lost to turbulence. A jump can also signal that the pipe's gradient or geometry has deviated from design.

Worse, the violent surface disruption strips dissolved  $H_2S$  into the headspace, initiating crown corrosion downstream. One hydraulic jump creates three compounding problems: energy loss, capacity loss, and an active corrosion zone hundreds of feet away and where CCTV would code the damage without ever identifying the upstream cause.

**CMOM CAPACITY CONNECTION**

CMOM requires utilities to evaluate capacity, identify hydraulic limitations, and shift from reactive to preventive maintenance. A hydraulic jump is a direct, measurable indicator that the pipe's hydraulic performance has deviated from its design envelope. It is exactly the "early warning sign" the CMOM framework asks utilities to detect — and until now, they have had no mechanism to find it in large gravity sewers.

**THE PACP BLIND SPOT**

PACP has no defect code for a hydraulic jump. No code for "flow regime transition," no code for "energy dissipation event." Even if a CCTV crawler or float physically traversed this location, the unit itself occupies cross-sectional area and alters the flow regime — the jump may shift, change intensity, or

### Report and Build

**Output: Red Flag Report (.pdf)**

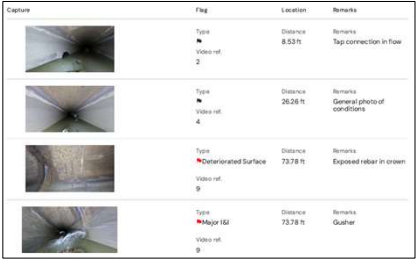

**Output: Video Data (.mp4)**  
Segmented and Georeferenced

**Output: Microsoft Exchange Database File (.mdb)**

- o Available for importing into Asset Management Software
- o VLC Media Player (view 360 video and orient as needed)

**Output: Change Logs**

- o Change logs are created and archived for consecutive, ongoing FlowSIGHT deployments

18

### FlowSIGHT : Case Studies

**Duckett Ck Sanitary District**

**Project Name: Confirmation Screening**

**Location: O'Fallon, MO**

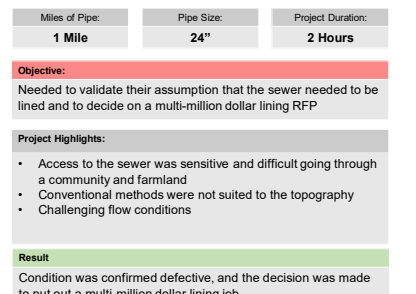

Miles of Pipe:	Pipe Size:	Project Duration:
<b>1 Mile</b>	<b>24"</b>	<b>2 Hours</b>

**Objective:**  
Needed to validate their assumption that the sewer needed to be lined and to decide on a multi-million dollar lining RFP

**Project Highlights:**

- Access to the sewer was sensitive and difficult going through a community and farmland
- Conventional methods were not suited to the topography
- Challenging flow conditions

**Result**  
Condition was confirmed defective, and the decision was made to put out a multi-million dollar lining job.

**FlowSIGHT™ : Case Studies**

**AGS | subterra**  
www.adsenv.com/flowsight

**Clarksville, TN**

**Project Name: Clarksville, TN**  
**Location: Clarksville, TN**

Miles of Pipe:	Pipe Size:	Project Duration:
<b>2.0 Miles</b>	<b>24" – 36"</b>	<b>0.5 days</b>

**Objective:**  
Client had a failure in a similar fiberglass pipe and needed to confirm integrity of 2 mile of critical pipe

**Project Highlights:**

- Because of the remote nature of the line, traditional inspection methodology could not be deployed.
- The versatility of the SewerScout allowed it to be transported to the location where it inspected 2 miles of fiberglass pipe.
- The entire deployment was completed in 2 hours.
- Good Bill of health – one small hole

**Result**  
Integrity for the 2 miles of pipe was confirmed onsite to be in a good state. Follow up report was delivered. One Defect Found

22

**Bonus Video – Failed Liner**

23

**Conclusions & Takeaways**

**AGS | subterra**  
www.adsenv.com/flowsight

- Sewer Screening technology is (1) fast and (2) cost effective
  - Can be rapidly adopted and deployed
- Screening is not a replacement for traditional diagnostic technologies
  - Think of it as a supplement that helps us prioritize these technologies
- Screening large diameter piping more routinely can:
  - Provide a data input to help prioritize or de-prioritize assets (Now, Soon, Later)
  - Help pinpoint the use of more expensive diagnostic technologies
  - Lead to better decision making and funding decisions
  - Have “Peace of Mind” that your utility won’t make National Headlines
